

Notes and documentation

Guideline on how to use charts, colors, everything always considering accessibility principles.

Disclaimer

The library can't contain every type of chart, so it only includes the most commonly used ones. If a particular chart type will be used in multiple projects, it can be added to the library, otherwise it should be stored locally.

Please, make sure your project is using the latest version of the components.

Color styles

The majority of chart components are available in two color variations: Monochrome, which uses different shades of a single color, and Colored, which offers a ten-color palette suitable for both light and dark themes.

What style is the most suitable?

The leading principle is to prioritize legibility and simplicity whenever feasible.

The most appropriate choice depends on the number of charts and metrics on the section, together with the type of chart being used.

For basic charts, a Monochrome style with default colors must be preferred.

In case of multiple charts with 1-3 metrics, the Monochrome style can still be used, but the default colors should be modified for each chart.

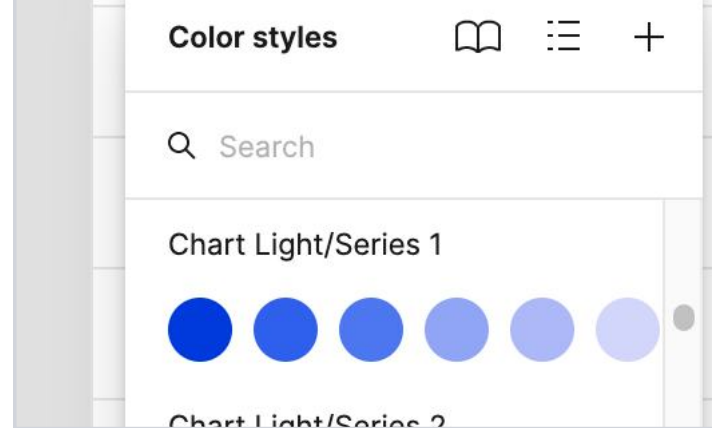

When dealing with more than six metrics (lines, bars, etc.) in a single chart, the Ten-color Style is the most appropriate choice.

The Monochrome style

Primary and Dark Primary palettes must be used for both light and dark themes.

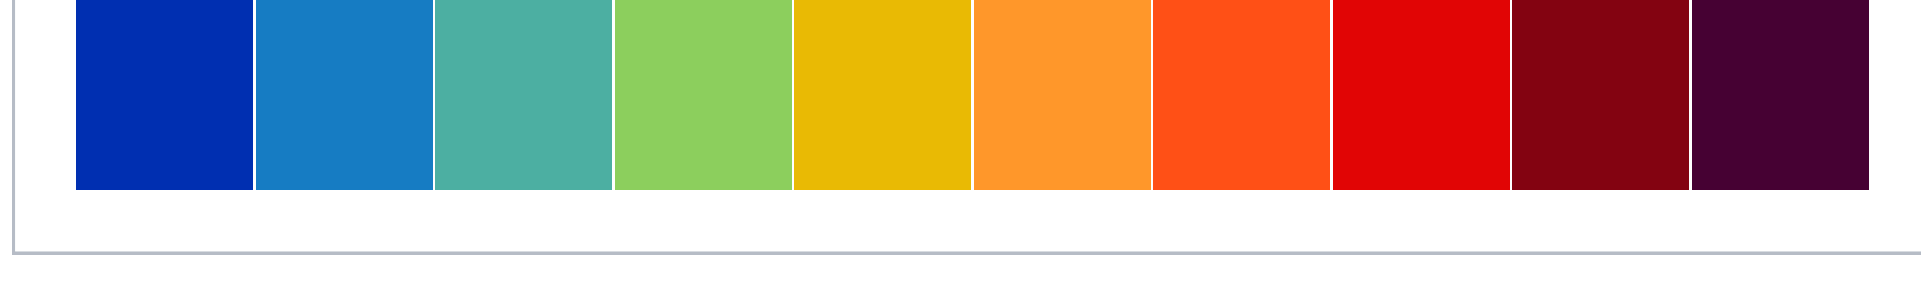

Alternatively, it is also acceptable to use shades of Chart Light/Series 1 and Chart Dark/Series 1, directly from the "Color Styles" module.

In case of Line charts, it is recommended to use different shades of the primary palette to get a better contrast and therefore increase legibility.

The Ten-color Style

For the light theme, please use Chart Light/Series [1-10]/600.

For the dark theme, please refer to the Chart Dark/Series [1-10]/600.

Why this set of colors?

The main reason is to be compliant with Accessibility principles.

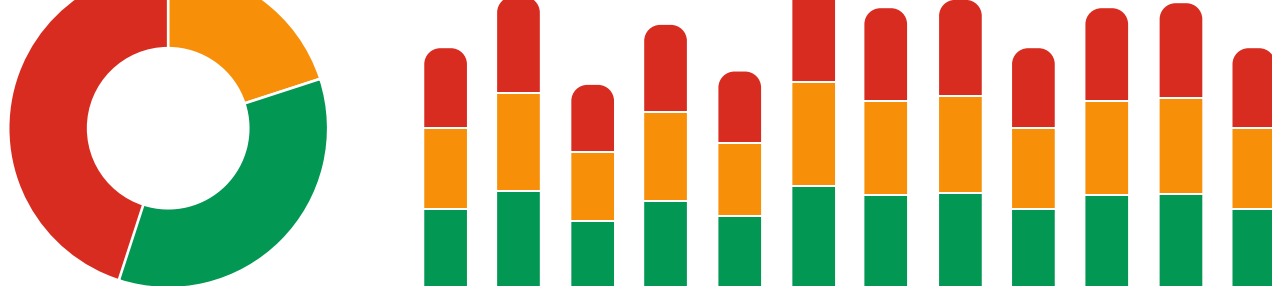

Below are examples of how individuals with three different kinds of color blindness perceive the original ten-color palette.

Alternative Styles

Although this documentation is still a recommendation and not a strict requirement, exercising common sense is appreciated. Please, always ensure that the "customized" charts are accessible.

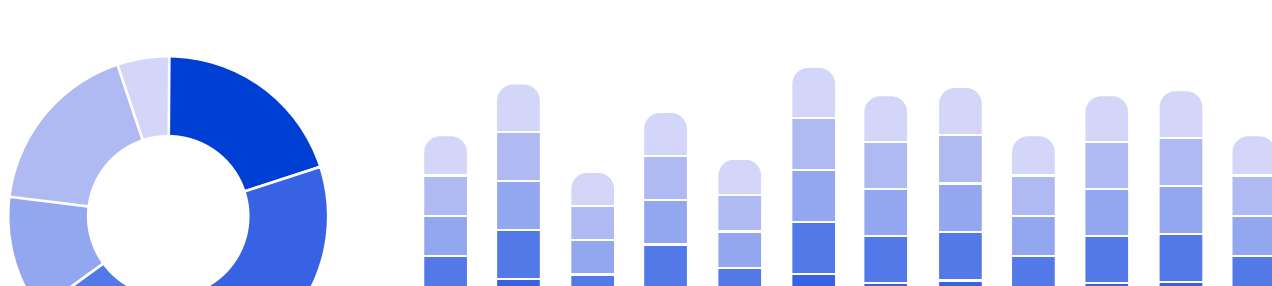

For instance, if the chart conveys a semantic meaning such as good or bad, it is acceptable to use colors from the Success, Warning, and Error palettes accordingly.

Colors order

The order of the colors is important from UX and accessibility perspective.

The Monochrome charts should be ordered by color shade. It is important to ensure that the most important metric is displayed with the highest contrast on the chart.

When using the ten-color style, there are two suggested approaches of selecting colors for charts. The choice is based on two main scenarios:

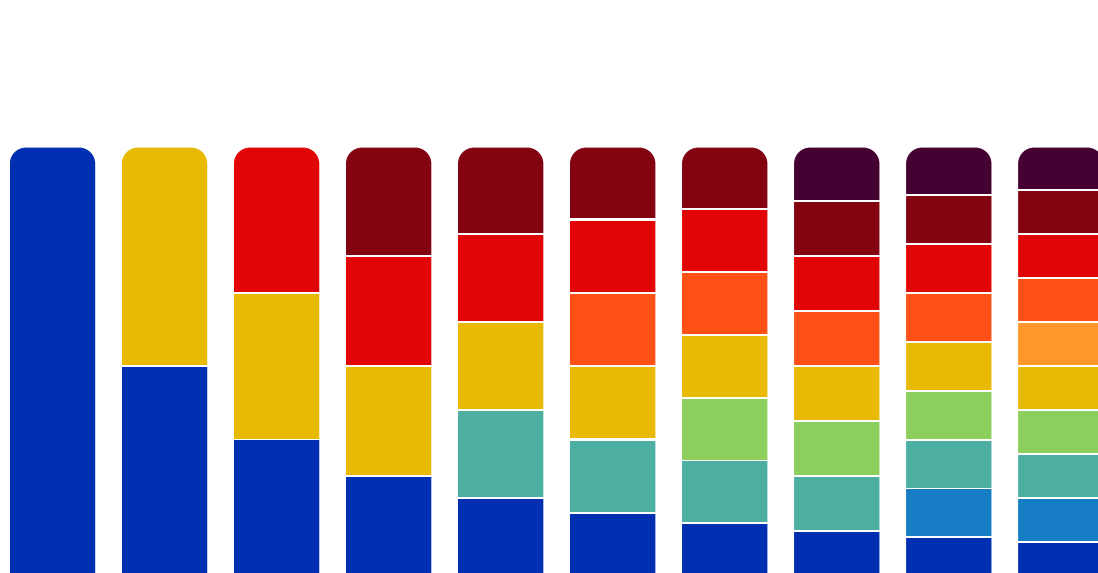

Dynamic pages:

A situation where the number of metrics or charts are not defined. Alternatively, users can add/remove metrics based on needs.

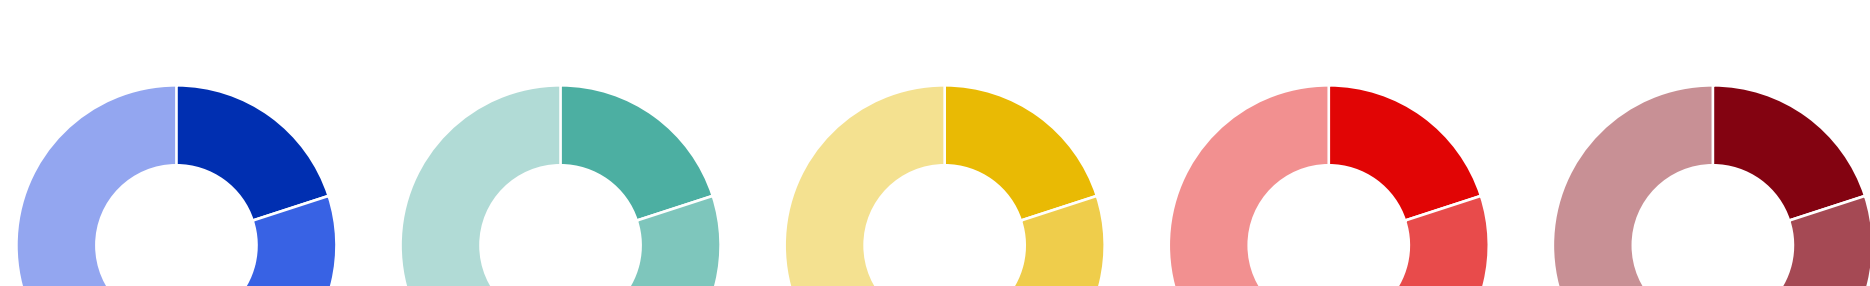

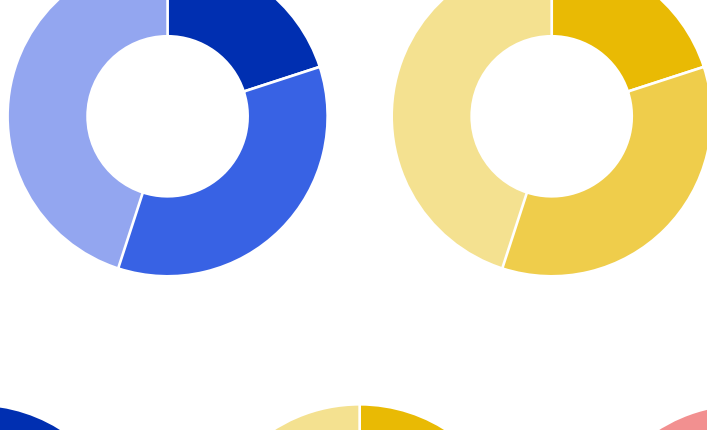

Here we strongly recommend to select the Series 1→10 color from Styles.

Pre-built pages:

In the second scenario, the number of displayed metrics/charts is fixed. The recommendation here is to select the colors for each chart based on the predefined order.

Example:

etc.
